NOTIFICATION DATE	DELIVERY MODE
-------------------	---------------

09/16/2009

ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

Docketing.US@motorola.com

Office Action Summary	Application No. 10/049,812	Applicant(s) SPRUNK ET AL.	
	Examiner BRANDON S. HOFFMAN	Art Unit 2436	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 07 July 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-7 and 10-19 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-7 and 10-19 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. Claims 1-7 and 10-19 are pending in this office action.
2. Applicant's arguments, filed April 23, 2009, have been fully considered in a pre-appeal conference and it was decided to reopen prosecution.

Claim Rejections

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 101

4. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

5. Claims 1-7 and 16-19 are rejected under 35 U.S.C. 101 based on Supreme Court precedent and recent Federal Circuit decisions, a 35 U.S.C § 101 process must (1) be tied to a particular machine or (2) transform underlying subject matter (such as an article or materials) to a different state or thing. In re Bilski et al, 88 USPQ 2d 1385 CAFC (2008); Diamond v. Diehr, 450 U.S. 175, 184 (1981); Parker v. Flook, 437 U.S. 584, 588 n.9 (1978); Gottschalk v. Benson, 409 U.S. 63, 70 (1972); Cochrane v. Deener, 94 U.S. 780,787-88 (1876).

An example of a method claim that would not qualify as a statutory process would be a claim that recited purely mental steps. Thus, to qualify as a § 101 statutory process, the claim should positively recite the particular machine to which it is tied, for example by identifying the apparatus that accomplishes the method steps, or positively recite the subject matter that is being transformed, for example by identifying the material that is being changed to a different state.

Here, applicant's method steps are not tied to a particular machine and do not perform a transformation. Thus, the claims are non-statutory.

The mere recitation of the machine in the preamble with an absence of a machine in the body of the claim fails to make the claim statutory under 35 USC 101.

Note the Board of Patent Appeals Informative Opinion Ex parte Langemyer et al.

Claim Rejections - 35 USC § 103

6. Claims 1-7 and 10-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Menezes et al. (Handbook of Applied Cryptography, 1997, section 13.3.1, pages 551-553 and 578-581) in view of Weiant, Jr. et al. (U.S. Patent No. 6,044,350).

Regarding claim 1, Menezes et al. teaches an asymmetric cryptographic processing system using a multiple key hierarchy, the asymmetric cryptographic processing system comprising:

- A first key for performing asymmetric operations at a first rate, wherein each operation requires a first cryptographic processing time (page 552, step 3, *data*

keys, provide cryptographic operations on user data, tend to be short-term keys);
and

- A second key for performing an asymmetric cryptographic processing operation to update the first key (page 552, step 2, *key-encrypting keys* and pages 578, section 13.7.2 through page 580), wherein the second key is used for cryptographic processing operations for the first key at a second rate that is less often than the first rate (page 552, step 2, *key-encrypting keys*, the key-encrypting keys are used less often than the keys that they encrypt).

Menezes et al. does not specifically teach the second key requires a second cryptographic processing time greater than the first cryptographic processing time.

Weiant, Jr. et al. teaches the second key requires a second cryptographic processing time greater than the first cryptographic processing time (fig. 3).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine the second key requiring more processing time than the first key, as taught by Weiant, Jr. et al., with the method/medium of Menezes et al. It would have been obvious for such modifications because longer length keys take more time to process, in order to provide more security, with a tradeoff that the key does not have to be replaced as often.

Regarding claims 2-5, Menezes et al. as modified by Weiant, Jr. et al. teaches wherein the system is used to cryptographically process and transfer digital [voice/audio/video] data in a network (see col. 3, lines 32-38 of Weiant, Jr. et al.).

Regarding claim 6, Menezes et al. as modified by Weiant, Jr. et al. teaches wherein the second key is hard coded into the system at the time of manufacturing the system (see page 551, section 13.3.1, step 1 of Menezes et al.).

Regarding claim 7, Menezes et al. as modified by Weiant, Jr. et al. teaches wherein a plurality of digital cryptographic processing systems are coupled by a telecommunications system, wherein the second key is distributed to two or more of the asymmetric cryptographic processing systems via the telecommunications system (see fig. 2 of Weiant, Jr. et al.).

Regarding claim 10, Menezes et al. as modified by Weiant, Jr. et al. teaches a method for providing secure data transactions in a telecommunications system, wherein a digital processing device receives information from the telecommunications system (see fig. 2, ref. num 234 of Weiant, Jr. et al.), wherein the digital processing device uses a first asymmetrical cryptographically processed key to perform an asymmetric cryptographic processing operation to decode the information wherein the cryptographic processing operation is at a first level of complexity requiring a first amount of resources by the processing device (see page 552, step 3, *data keys* of Menezes et al.), wherein

the cryptographic processing operation is performed at a first rate of cryptographic processing operations per unit time (see page 552, step 3, *data keys* of Menezes et al., provide cryptographic operations on user data, tend to be short-term keys), the method comprising:

- Transferring a second asymmetrical cryptographically processed key to the digital processing device, wherein the second asymmetrical cryptographically processed key is used in an asymmetric cryptographic processing operation at a second level of complexity requiring a second amount of resources by the processing device that is higher than the first amount of resources (see page 552, step 3, *data keys* of Menezes et al., the data keys are used, perhaps for every type of data they encrypt);
- Updating the first asymmetrical cryptographically processed key from time-to-time (see page 552, step 3 of Menezes et al.), wherein the updating of the first asymmetrical cryptographically processed key occurs at a second rate of cryptographic processing operations per unit time that is less than the first rate of cryptographic processing operations per unit time (see pages 578, section 13.7.2 through page 580 of Menezes et al. and see fig. 3, key B of Weiant, Jr. et al.), wherein the updating includes the following substeps:
 - Encoding a substitute first asymmetrical cryptographically processed key with a second key, so that the resulting cryptographically processed substitute first asymmetrical cryptographically processed key is decodable by the second asymmetrical cryptographically processed key (see page

552, paragraph below step 3 of Menezes et al., keys at one layer are used to protect items at a lower level); and

- Transferring the substitute first asymmetrical cryptographically processed key to the digital processing device so that the substitute first asymmetrical cryptographically processed key is used in subsequent cryptographic processing operations by the digital processing device (see fig. 2, ref. num 234 of Weiant, Jr. et al.).

Regarding claim 11, Menezes et al. as modified by Weiant, Jr. et al. teaches further comprising:

- Transferring a third asymmetrical cryptographically processed key to the digital processing device (see page 551, section 13.3.1, step 1, master key of Menezes et al.), wherein the third asymmetrical cryptographically processed key is used in an asymmetric cryptographic processing operation at a third level of complexity requiring a third amount of resources by the processing device that is higher than the second amount of resources (see page 551, section 13.3.1, step 1 of Menezes et al. and fig. 3, key C of Weiant, Jr. et al.);
- Updating the second asymmetrical cryptographically processed key from time-to-time (see page 552, step 2 of Menezes et al.), wherein the updating of the second asymmetrical cryptographically processed key occurs at a third rate of cryptographic processing operations per unit time that is less than the second

rate of cryptographic processing operations per unit time (see fig. 3, key C of Weiant, Jr. et al.), wherein the updating includes the following substeps:

- Encoding a substitute second asymmetrical cryptographically processed key with a third asymmetrical cryptographically processed key, so that the resulting cryptographically processed substitute second asymmetrical cryptographically processed key is capable of being cryptographically processed by the third asymmetrical cryptographically processed key (see page 552, paragraph below step 3 of Menezes et al., keys at one layer are used to protect items at a lower level); and
- Transferring the substitute second asymmetrical cryptographically processed key to the digital processing device so that the substitute second asymmetrical cryptographically processed key is used in subsequent cryptographic processing operations by the digital processing device (see fig. 2, ref. num 234 of Weiant, Jr. et al.).

Regarding claims 12-15, the examiner takes Official Notice that the resources include [processing time/transistor density on an IC/memory capacity/data bandwidth] because these resources are well-known tradeoffs of resource intensive actions as cryptography.

Claims 16-19 rejected under 35 U.S.C. 103(a) as being unpatentable over Van Oorschot et al. (U.S. Patent No. 5,850,443) in view of Menezes et al. (Handbook of Applied Cryptography, 1997, section 13.3.1, pages 551-553 and 578-581).

Regarding claim 16, Van Oorschot et al. teaches a method of updating a cryptographic key used for decrypting distributed data, the method comprising:

- Generating a first key for decrypting the distributed data, the first key of a first length (col. 6, lines 25-29);
- Encrypting the first key with a second key, the second key of a second length, wherein the second length is longer than the first length (col. 6, lines 29-31); and
- Distributing the encrypted first key (fig. 1 and col. 6, lines 31-33).

Van Oorschot et al. does not teach wherein the first key updates the cryptographic key; and wherein the cryptographic key, the first key, and the second key encrypt and decrypt data using a similar class of algorithm to encrypt and decrypt data.

Menezes et al. teaches wherein the first key updates the cryptographic key (pages 578, section 13.7.2 through page 580); and wherein the cryptographic key, the first key, and the second key encrypt and decrypt data using a similar class of algorithm to encrypt and decrypt data (page 580, section 13.45, Remark, the figure and accompanying description applies mainly to public-key pairs).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine updating the cryptographic key with the first key and all keys are from a similar class of algorithm, as taught by Menezes, with the method of Van Oorschot et al. It would have been obvious for such modifications because the systems involved would only have to be programmed to handle one type of cryptographic algorithm.

Regarding claim 17, Van Oorschot et al. as modified by Menezes et al. teaches further comprising distributing data encrypted with the first key (see fig. 2 of Van Oorschot et al.).

Regarding claim 18, Van Oorschot et al. as modified by Menezes et al. teaches further comprising:

- Generating a third key to replace the first key, the third key of a third length, wherein the third length is shorter than the second length (see col. 6, lines 46-49 of Van Oorschot et al.);
- Encrypting the third key with the second key (see col. 6, lines 43-46 of Van Oorschot et al.); and
- Distributing the encrypted third key (see fig. 3 of Van Oorschot et al.).

Regarding claim 19, Van Oorschot et al. as modified by Menezes et al. teaches further comprising distributing data encrypted with the third key (see fig. 4 of Van Oorschot et al.).

Final Remarks

7. Applicant previously argued that Menezes discloses the time period (long-term and short-term) over which the data key is valid, and not the rate (frequent or infrequent use) at which the data key is used for performing asymmetric operations. Menezes does mention the data keys being a short-term key and the key-encrypting keys as being long-term keys, which means the data keys are only meant to last a short time compared to the key-encrypting keys. However, Menezes also mentions that the data keys are session keys (see page 553, section 13.10, short-term keys). Session keys are used repeatedly during an entire session, and then they are updated for the start of a new session. The rate at which the session key is used is much higher than the keys used to update the session key.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to BRANDON S. HOFFMAN whose telephone number is (571)272-3863. The examiner can normally be reached on M-F 8:30 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nasser G. Moazzami can be reached on 571-272-4195. The fax phone
